# $\mathsf{Urdu} \to \mathsf{English}$

اس حملہ کے بعد بڑی تعداد میں مقامی باشندوں نے علاقوں کو خالی کردیا ہے .

In this attack a large number of local residents has should vacate areas.

 Current state-of-the-art translation models struggle with language pairs which exhibit large differences in structure.

# Workshop overview

#### Input:

• Existing procedures for unlabelled synchronous grammar extraction

#### Output:

- New unsupervised models for large scale synchronous grammar extraction,
- A comparison and analysis of the existing and proposed models,
- Extended decoders (cdec/Joshua) capable of working efficiently with these models.

# Workshop Streams

Expand, describing challenges faced in each stream.

- Implement scalable SCFG grammar extraction algorithms.
- Improve SCFG decoders to efficiently handle the grammars produce.
- Investigate discriminative training regimes to leverage features extracted from these grammars.

#### **BLEU**

$$BLEU_n = BP \times \exp\left(\sum_{n=1}^{N} w_n \log p_n\right)$$

$$BP = \begin{cases} 1 & \text{if } c > r \\ \exp\left(1 - \frac{R'}{C'}\right) & \text{if } c <= r \end{cases}$$

- BP is the Brevity Penalty,  $w_n$  is the ngram length weights (usually  $\frac{1}{n}$ ),  $p_n$  is precision of ngram predictions, R' is the total length of all references and C' is the sum of the best matching candidates.
- statistics are calculate over the whole document, i.e. all the sentences.

#### Remember:

- Idea: Learn synchronous grammar labels which encode substituteability; phrases which occur in the same context should receive the same label.
- Result: Better models of translation structure, morphology and improved decoding algorithms.
